

EXMAR

“We have been pleasantly surprised at the speed of deployment. Our project is ahead of schedule having already migrated the data and deployed the first vessel in early January. Our experience with the Ulysses software (Task Assistant) is in its early days, however, we can see clearly that the two most important obstacles in shipboard enterprise software have been overcome: TA is easy for our seafarers to use and populating the ship specific databases has been achieved smoothly.

Having explored somewhat further the possibilities of Task Assistant, we are confident that we have acquired an excellent tool for realizing a number of goals set in the TMSA guidelines.”

Task Assistant is developed and supported by Ulysses Systems, a leading provider of innovative business intelligence solutions to the maritime and other industries. Ulysses provides solutions based upon advanced telecommunications and information systems technologies that help people work intuitively without special software training. Ulysses' product design has at its core an understanding of how human beings perceive and process information, delivering systems that work the way people do and making information processing fundamentally more efficient.
